REMARKS.

* "Prop. Sky Clear."
Entirely overcast.
10 Not a cloud to be seen.

Oct 25 at 12 M civil time left Pilot off Wood esland light & proceeded to sea

Oct 26 Sea time commences my journal pleasant & passing clouds

Oct 27th Moderate N.E. wind

28 at 1 P.M. fresh gales from N.W cloudy heavy squalls

29th fresh Gales from N W passing clouds

30th Oct Moderate breezes passing clouds

Middle Moderate

Latter part light airs from S E & smooth sea all sail set Steering

31st Oct first part Moderate S.E. all sail set heading S S W
at 7 a m tacked to the E double reefed Topsails

ERRATUM.

In the note relative to "Proportion of Sky Clear," at top of right hand page of Abstract Log, the figure "**3**" has been erroneously printed, on *some pages*, to designate "Entirely overcast." The note should read as follows:—

* "Prop. Sky Clear."
0 Entirely overcast.
10 Not a cloud to be seen.

☞ It is recommended that before any entries are made in the Abstract Log, the above-named error be corrected with pen and ink, on every page on which it occurs.

☞ Whether the day commences at noon or midnight, always call from noon to 8 P. M. "First Part."

REMARKS.

* "Prop. Sky Clear."
0 Entirely overcast.
10 Not a cloud to be seen.

Nov 3d 1866 Middle & latter part fresh gales light squalls
had chance this to get along on my proscribed track

Nov 4th all this day squally & W winds from fresh to light
at 8 a.m. whole topsails & M T Gallantsails

Nov 5. first part moderate rainy light squalls

Middle light airs & calms

Latter part fresh gales & squally at 12 reefed Topsails & Mainsail
this is the 5th day Dec. S. & W. winds when will they end?

Nov 6th first part fresh gales & squally
Middle fine whole sail breezes at 12 Topgallant sails set

Latter part fine breezes T.G. sails set by the wind
one week by the wind. Oh when shall I get a slant.

Nov 7th first part Topgallant breezes passing clouds
Middle fresh gales & heavy squalls furled upper Topsails
latter part more moderate at 10 a m whole Topsails at 12 M T G sails

Nov 8 first & Middle fresh breezes & squally reefed Topsails
latter part strong gales heavy squalls at 12 M furled courses
& upper Topsails Squalls of rain

Nov 9th first & middle heavy gales & heavy squalls
at 6 P.M. clewed up & furled both yard arms of F. & M. Topsails
very heavy squalls Some rain latter part heavy gales & squally

Nov 10th first part heavy gales & heavy squalls with rain
Middle more moderate but squally set whole lower Topsails
6 to 9 a m light airs from N.W. to N.E. & round the compass
latter part fresh breezes from S.S.W. passing clouds
this is certainly the worst chance I have ever seen in my 40
years to sea cannot get a slant. am now 15 days out &
no further along I must make a long passage as it is now

Nov 11th first part fresh breezes & passing clouds
Middle strong Gales & heavy squalls at 12 furled all sail except
lee clews of Topsails & Staysails heavy squalls with rain

☞ Whether the day commences at noon or midnight, always call from noon to 8 P. M. "First Part."

REMARKS.

* "Prop. Sky Clear."
0 Entirely overcast.
10 Not a cloud to be seen.

November 21st 1866.

21st Middle & latter part Moderate breezes & Smooth Sea
at 8 a.m. Saw a Sail to the Eastward Steering South
27 days out all well.

22d first & Full Moon to day
first & Middle fine breezes & pleasant weather
all Sail Set
Latter part fine breezes 6 to 8 a m raining wind at N W
at 12 M. Set Topmast Steering Sail for the first time
Since leaving port
28 days Out

23d all this day Moderate breezes & pleasant all Sail Set
Sea Smooth Saw a Brig Steering West
I have seen none of the Gargassa weed as I have in past passages

24 all this day Moderate winds & pleasant Smooth Sea
at 10 A.M. Saw a Bark Steering South by West
this is a hard chance sure I cannot get along without wind
I am now 30 days out & no farther along, I ought to be South of the line

25 all this day light airs W. N. W. & E. N E. smooth Sea Swell from N W
and has been for one week past it appears like a Southerly wind
31 days Out

26th first part Moderate breezes E. E S E. at ¼ P.M. heavy Squall from Sea
thunder & lightning heavy rain
Middle Moderate & heavy rain
Latter part Moderate & Squally heavy rain I have never seen such
weather in these Latitudes. Sandsmen pray pity Me.

27 first & Middle light breezes South heavy rain
32 days Out.
Latter part calm Sea from all directions
33 days out. Shall I ever get there

28 All this day Calm. Smooth Sea pleasant Weather
I am about discouraged. I think no one ever had such
a hard change as I have had especially at this season of the year
I ought to have good Strong trades here instead of calms.
I am in a good position 34 Days Out. God Save the King

29 first & Middle Calm & light airs East pleasant
Latter part Moderate E. S. E. all Sail by the wind

30 first part Moderate breezes pleasant appears like Trades

☞ Whether the day commences at noon or midnight, always call from noon to 8 P. M. "First Part."

30 Middle & latter part fresh trades E to Ed E pleasant
Got the trades at last fine breezes & pleasant weather
36 Days Out. all well.

1st December. all this day moderate breezes from Ed E. to East pleasant
all Sail set. Strong tide rips but no currant
trade like appearenced but I fear they will not last long
37 Days Out Tought to be in do Port

2 all this day fine breezes first part smoott Middle & latter
part rough cass se from 4 to 6 a.m. Squally heavy rain
thick hedvy appearences in the South I fear the trades are about
don
38 Days Out.

3 first & middle fine breezes East passing clouds confused Sea from
all points of compass at 3 a.m. Squally with rain & calms
latter part calm. the trades are don pave had them from 15° to
6 degrees heave bony trades Nothing to the North of East on an average
headed sharp all the time as I have been the entire passage
I have got to fight it the best I can until I get the S E trades 39 Day Out

4th first & middle Calm E & South airs calm throught the night raing
latter part moderate breezes N. E. at 8 a.m. set Topmast Studdingsail
for the 2d time on the passage 30 miles East currant. thank God
for this breeze I did not expect it. I fear it will not last long
cross sea from all points of Compass 40 Days out. 4 6° North Bully

5th first part moderate N. E. breezes middle E Squally mod rain
latter part fresh East breezes Squally casting South. appearances like
trades. this Sail in company bound South. I call it the S E
trades. I ought to have Something to get me along. 41 Days out.

6 first & middle moderate breezes S E Squally with rain
latter part fresh S S E Squally of course & rain in company with
two Sail bound South. dirty appearences. Glass to low for good
S. E. trades expect to se it rise soon 42 Days Out.

7th all this day fine breezes S S E & pleasant. few light
Squally it is certainly the S E trades getting along quite
well braced sharp of course & have ben allmost the whole passage
I hope the wind will cant more Easterly 43 Days out No Courant

8th all this day fine breezes S E by E pleasant weather
at 1 P.M. Crossed the Equator Long 28.50 by Chron 43 days 12 hours

ABSTRACT LOG FOR THE MERCHANT SERVICE.

THE Maritime Conference at Brussels recommended the form of an abstract log, especially for men-of-war. The nations represented at that Conference, were Denmark, Sweden, Russia, Norway, Portugal, Holland, France, Belgium, England, and the United States. It is presumed that all these nations will, as the United States have done; as Prussia and Spain, who were not in the Conference, are ready to do, viz: approve that form, and command it to be kept on board of all their men-of-war at sea, and *recommend, at least*, that the same be done in their merchant service.

The following is the order of the Hon. J. C. Dobbin, the Secretary of the Navy upon this subject, to the officers of the United States Navy:—

GENERAL ORDER:

NAVY DEPARTMENT, *November* 3, 1853.

The form of the "Abstract Log," recommended by the late Maritime Conference at Brussels, is hereby approved and adopted for use in the Navy of the United States.

It is recommended to navigators generally, and will be faithfully kept on board of all vessels in the naval service.

Commanding officers of vessels afloat are specially charged with the execution of this order, and they will transmit copies of the Abstract kept on board, to the Chief of the Bureau of Ordnance and Hydrography at the end of the cruise, and at such other times as he may direct.

(Signed) J. C. DOBBIN, *Secretary of the Navy.*

The intelligent navigator will perceive, by looking over the "Explanatory Notes," what remarks apply to the Merchant Service Log. For instance, those for column 15, "wet bulb," do not apply to this log, unless the navigator may think proper to use the wet bulb thermometer. Neither does what relates to the hours 2, 3, 4 P. M., 6, 9 A. M., and 10, in column 2 "hour" apply to the Merchant Service Log, unless the captain, as he is invited to do, shall choose to introduce in his log these hours. In that case, he is requested to give preference to those hours that are printed in heavy figures.

I quote the Explanatory Notes given by the Brussels Conference for keeping this log; to which I have made some additions. These additions are contained in brackets, thus [ ].

EXPLANATORY NOTES FOR KEEPING THE ABSTRACT LOG.

The name of the *last* place from which the vessel sailed, and the place to which she is going, should be stated in the abstract.

1*st Column.*—THE TIME inserted in the abstract log should be civil time; but if astronomical [or sea] time is inserted, it should be so stated at the commencement of the log. The months should be indicated by the Roman letters from I. to XII., January being I. [December XII.]

2*d Column.*—HOURS; this column contains all the hours at the even numbers, and in addition 9 A. M. and 3 P. M. The hours 4 A. M. and 9 A. M., Noon, 3 P. M. and 8 P. M. are printed in larger type, to indicate that it is at these hours that observations are especially required, as will be farther explained.

3*d Column.*—LATITUDE OBSERVED.

4*th Column.*—LATITUDE BY DEAD RECKONING.

5*th Column.*—LONGITUDE OBSERVED.

6*th Column.*—LONGITUDE BY DEAD RECKONING.

The latitude and longitude should be observed frequently at sea, and more especially about 4 A. M., Noon, and 8 P. M., and the result referred by the log to the hour nearest to which the observations were made, in order that the ship's position may be as accurately determined as possible at those times. This should be particularly attended to, when the ship is expected to cross or enter upon any of the great streams and currents of the ocean, the trade or periodical winds. The position by dead reckoning should be deduced from the last observation for latitude and longitude. If the longitude is determined by lunar distances, note it in the column with its proper sign, ☽, *☽, and if by chronometer, ☉ or *. When in sight of land, and the ship's position is determined by bearings, it is still desirable that the position of the ship should be given in latitude and longitude, in the proper column.

7*th* and 8*th Columns.*—DIRECTION AND RATE OF CURRENTS. On ordinary occasions the currents should be determined at noon on each day, by comparing the position of the ship, as determined by observation, and its position, as found by dead reckoning; the direction and rate of the current in nautical miles for the last 24 hours should be given [or better, for the time during which it has been felt]; besides the daily entry at noon, the rate and direction of currents should be noted at shorter intervals, when the ship is in the vicinity of the great oceanic currents, or when it is supposed that the currents may sensibly vary in the 24 hours.

9*th Column.*—THE OBSERVED VARIATION should be entered in degrees and minutes; and when the variation is determined by observation of the moon or a star, the sign ☾ or * should be placed after the entry, thus: 23° 16′ W. ☾.

The variation should be corrected for local attraction; in other words, the variation entered should be what the variation would have been, had the ship been heading at the time of observation upon the course, in which the local variation would be 0.

It is desirable that every vessel should be provided with a *standard compass*, with which all the observations for variation should be made. The position of the standard compass, or of the one used, should be that at which the local attraction is the least, and the compass should always be placed in the same place. When the variation has not been observed, the variation *used* should be corrected for local attraction, and noted.

10*th Column*—DIRECTION
11*th Column*—FORCE
} of the WIND.

The direction and force of the wind should be regularly entered at 4 A. M., Noon, and 8 P. M. The force and direction entered should be that which has been most prevalent during the eight preceding hours. The direction should be by compass, and expressed in points. The force of the wind should be indicated by the figures given in the first page; if there are squalls, their force should be given in a parenthesis ( ), opposite the hour at which it takes place.

[Columns 10 and 11 are therefore to be filled *only* at 8 P. M., 4 A. M., and Noon. The force and direction of the wind entered at 8 P. M. must be the force and direction that have been most prevalent during the interval between Noon and 8 P. M.; at 4 A. M. enter the prevalent character as it has been since 8 P. M.; and at Noon, the prevalent character since 4 A. M. must be entered. Whether the time kept on board be sea or civil time, from Noon to 8 P. M. is understood to be what in common parlance among seamen is known as the FIRST PART. In like manner, from 8 P. M. to 4 A. M., whether the day commence at noon or midnight, is understood to be the MIDDLE PART.]

12*th* and 13*th Columns.*—The BAROMETER AND ITS THERMOMETER should be observed, if possible, at all the hours given in column 2, and at least at 4 and 9 A. M., Noon, 3 and 8 P. M. [The thermometer attached to the barometer—and if none be attached, one should be tied to the lower end—should be carefully noted whenever the barometer is observed, for we depend upon it for an important correction for the Bar.]

[Navigators, who are co-operating in this system of research, will please recollect that we are now about to turn over a new leaf, especially as it regards the meteorological observations usually made at sea. We have pushed these observations after the old plan until they have of themselves proclaimed their own imperfections, and have demonstrated the necessity of more accurate observations made with instruments that are *true*.

We are now setting about to catechize nature closely. All who co-operate with us have agreed to propound to her certain questions. Now, unless these questions be truly interpreted, we cannot reconcile the answers that are to be given; and certainly they cannot be truly interpreted unless the instruments used be themselves true.

We want, therefore, when a thermometer is read, to know that its error does not exceed a certain very small quantity—less than a degree always. And, in like manner, when the barometer is read, we want the means of correcting it of its errors, even to the hundredth part of an inch. Every barometer has its sources of error. Mercury, for instance, is very expansible; it is lighter at a temperature of 90° than it is at a temperature of 32°; and with exactly the same atmospheric pressure it will stand higher when the temperature of the column of mercury is 90° than it will when the column of mercury is at any temperature below that. Hence, whenever the barometer is read, we want to know what the temperature of the mercury in the cistern is, in order that we may make this correction. In like manner, it is equally important to know the height of the barometer in the cabin above the level of the sea, and the elements for the other corrections named at page VII.]

14*th* and 15*th Columns.*—THE DRY AND WET BULB THERMOMETERS should be observed at the same hours as the barometer. If it rains at the time when the observation with the wet bulb is taken, put the letter B after the temperature. Before reading the wet bulb thermometer, the bulb [or rather, a thin old linen rag should be tied tightly about the bulb, and then the bulb] should be moistened with [clean] fresh water, and allowed to remain a few minutes in the open air, in the shade, and where strong currents of wind from the sails cannot affect it.

All the thermometers ought to have two scales, one that of the country to which the ship belongs, the other the centigrade.

16*th Column.*—THE FORM AND DIRECTION OF THE CLOUDS should be noted at least at 4 A. M., Noon, and 8 P. M., and as they appear at the time of observation. The form of the clouds should be indicated by the letters given at page VI. When the clouds are observed to be going in different directions at the same time, the direction of the upper ones should be stated above that of the lower, and separated by a bar, thus: $\frac{\text{N. N. E. C}}{\text{S. W. Cu}}$. [Plate XVI. shows the form of Clouds. It gives the forms used by the Smithsonian Institution, and by meteorologists on shore generally.]

17*th Column.*—THE PROPORTION OF THE SKY CLEAR should be indicated by figures from 0 to 10. Thus 8 indicates that $\frac{8}{10}$ of the sky is clear.

18*th Column.*—FOG, RAIN, SNOW, AND HAIL. The number of hours of fog, rain, snow, and hail, in the eight preceding hours, should be noted at 4 A. M., Noon, and 8 P. M.

The letter A, indicates fog; C, snow;
B, rain; D, hail.

One or two bars placed under the hours indicate degree [intensity or quantity]: thus 3 B, is 3 hours of light rain; 3 B, [moderate] rain; 3 B, heavy rain.

The direction and force of the wind, etc., before, during, and after the rain, should be stated in the column of Remarks.

19*th Column.*—The State of the Sea during the eight preceding hours should be stated at 4 A. M., Noon, and 8 P. M., by means of the signs given on the second page. [These signs were omitted to be inserted in the original.]

20*th Column.*—Temperature of the Water at the Surface. For the hours at which the observations should be taken, see directions for the barometer and thermometer. The water should be taken up in a wooden bucket, as far as possible from the ship's side, and placed in the shade on deck; the thermometer should then be placed in the water, and left there for two or three minutes [five], and read afterwards, whilst the bulb is in the water. In addition to the ordinary observations, the temperature of the water should be taken when any particular circumstances may seem to make it desirable, as when there are changes in the color of the water, [or when the vessel is] in the neighborhood of ice, shoals, the gulf or other streams, and at the mouths of great rivers.

The temperature of the water should also be taken during thunderstorms, and when any electrical phenomena are observed.

21*st Column.*—The Specific Gravity of the Water at the Surface or at different Depths, should be noted at least once a day; when the water is taken from a certain depth, the depth should be entered under the specific gravity, and under a line $(\frac{0\,3\,9}{1\,5\,0})$. The specific gravity is stated without any other correction than that which the instrument employed may require. The temperature of the water should be placed in the 20th and 22d columns. It is desirable that a uniform scale should be adopted in the instruments used in ascertaining the specific gravity; that the specific gravity of distilled water should be the unit, and that of the sea-water expressed in decimals. [The hydrometer of commerce, that is, the one of glass, and in the shape of a thermometer with a huge bulb slightly loaded, used for proving spirits, is the one recommended for the American Service.]

22*d Column.*—The Temperature of the Water at different Depths should be taken at least once a day, according as circumstances may be more or less favorable; the temperature should be entered above the specific gravity and separated from it by a bar $(\frac{54°}{035})$; the unit of measure in depths is fathoms [of six feet each, English]. In taking water from moderate depths, it may be hauled up in a cylindrical box, 18 inches long, and 6 inches in diameter, having two valves in the ends opening upwards. This box may be either of wood or iron, and attached to the deep-sea lead. [Self-registering *metallic* thermometers are better.]

It is desirable, frequently, to try the temperature of the water at the depth of the ship's cock below the surface; the cock should be left open for 8 or 10 minutes before the bucket is filled, and the thermometer should be left two or three minutes [five] in the water, as before described, before reading it, and it may be well to note the rate of the ship at the time the cock was open. The temperature of the water at the surface should be observed, whenever the temperature at different depths is taken.

When there is a great difference between the temperature of the water at the surface, and at some depth, observe the indications of the wet and dry bulb thermometers, and note them in the column of Remarks.

Although these observations are of importance in every part of the globe, still, there are certain regions where the differences between the temperature at the surface and the temperature at certain depths have a particular interest. We may mention the regions of the trade-winds, the Indian Ocean, the Cape of Good Hope, and especially in the Lagullas current, and near the mouths of great rivers.

Column of Remarks.—The column of Remarks will contain everything which the captain may consider useful. We direct attention to the following points:—

1*st.* If the vessel is a steamer, state whether she was steaming or under sail at the time the observations are made.

Tempests, tornadoes, whirlwinds, typhoons, or hurricanes, etc.—Every circumstance connected with these should be stated in great detail; the different changes of the wind, the appearance of the sky and the clouds, of the sea and electrical phenomena, rain, hail, etc. The height of the barometer should be frequently noted, at least as often as there is a change of a tenth of an inch, and the time when the remarks are made [*i. e.* when the phenomena are seen, or when the observations are made], should be stated.

When *water-spouts* are observed, the time of their duration, their successive appearances, their formation, gyratory movement, translation, and breaking up, should be described.

Note the circumstances attending storms, the thunder, lightning, etc.; and when phenomena of this nature are observed by navigators, they should be guided in their observations by a reference to analogous phenomena, which they may have observed in other regions, more especially upon the edge of the Gulf Stream.

It is desirable to have the *temperature of the rain* compared with the temperature of the air.

When it *hails*, describe the *hailstones*, and the electrical phenomena.

Note the quantity of *dew*, the time when it commences to fall, and, in cases of extraordinary deposits, note the temperature of the air as close to the surface of the sea as possible, and at the same time at the masthead.

When *red fogs* or *showers of dust* are met with, describe the weather and the appearance of the sky, and obtain, if possible, specimens of the dust.

Observe the height of the *waves*, the distance between them, and their rate of progress.

Note the *tide rips* seen, particularly in the tropics, and the age of the moon at the time.

When the surface of the sea is covered with *pink or white patches* of water, as is often the case in the Pacific Ocean, describe them, and preserve specimens of the water in phials with ground-glass stoppers; if practicable, get a cast of the deep-sea lead, and take the temperature of the water at the surface, and at some depth.

When *deep-sea soundings* are taken, state the time the lead takes to descend each 100 fathoms, and carefully preserve whatever the lead brings up from the bottom. [Deep-sea soundings should always be made from a boat.]

It is much to be desired, for the sake of comparison, that the same sized line and the same shaped lead, of equal weight, should be used. [For description of those used in the U. S. Navy, see *Maury's Sailing Directions*, 6th ed. p. 225.]

In places where *ice* may be met with, observe the temperature of the water frequently; these observations are most valuable when there are fogs which may prevent the ice from being seen, as they may indicate its presence even at the distance of 2 or 3 miles, especially when the ice is to leeward.

Note the appearance of the ice, and the direction in which it has been drifted.

In addition to the *thermometers* usually supplied to ships, it is desirable that they should be furnished with others *with white, black, and blue bulbs*, colored with water-colors. These three thermometers should be exposed simultaneously to the sun in fine weather for some minutes at 9 A. M., noon, and 3 P. M., and occasionally at night [to the open sky] in time of dew; their indications should be entered in the column of Remarks.

Note the *shooting stars;* their point of departure and the point to which they appear to converge, the constellations which they traverse, their numbers in a given time. They should be especially observed about the 10th of August and the middle of November.

The *Aurora borealis;* the time of its appearance and disappearance, extent, form, position, intensity of light, color, its motions, and changes should be described.

Halos, rainbows, meteors, etc. should also be noted.

Carefully note the appearance of *birds, insects, fish, sea-weed, drift-wood*, and mention any circumstances which may throw light upon their appearance.

When at anchor, *tidal observations* should not be neglected, and the times of high and low water, if possible, should be observed; state the time also of change of tide, the rate and direction of the current at various stages, both

on the flow and ebb, and everything relative to this important question. Hourly meteorological observations, especially at the times of the equinoxes and solstices, would be very valuable.

In addition to the observations mentioned in the abstract log, it is desirable that each captain should write, at the end, any general remarks which his personal experience may suggest [as to the route pursued, currents, winds, &c., encountered by the way], more especially if he has frequently made the same voyage.

(1). Enter the class of the vessel, her name, country, and the name of the captain.

(2). If the vessel is of iron or wood; and mention the quantity of iron, if any, in the cargo.

(3). Enter the names of the places at which the vessel has called during her voyage.

(4). Name the meridian from which the longitude is calculated.

(5). Give the table of local deviation at the commencement and at the end of the voyage; and state in the log the manner in which it was determined, and if the vessel was loaded with any iron when the observation was made, or whether any iron as cargo was taken on board after the observation was made.

If practicable, the operation should be repeated during the voyage.

Describe, on pages VII. and VIII., the instruments you have on board, the manner of using them, and of making the observations.

DESCRIPTION OF INSTRUMENTS.

CONDITIONS UPON WHICH THE WIND AND CURRENT CHARTS ARE FURNISHED TO NAVIGATORS.

These Charts are based upon a system of voluntary co-operation; and, so far, they have been constructed from materials furnished principally by American shipmasters, and on condition of each one being supplied with such sheets of the Charts as relate to his cruising ground, and which his observations have helped to make.

It has been judged wise to extend this system of co-operation, seeing that it has worked so well in the American merchant service, to the merchant service of all other friendly nations.

Accordingly, the Hon. J. C. Dobbin, Secretary of the Navy, with a spirit of liberality deserving of the highest commendation, has authorized me to place these Charts and Sailing Directions at the disposal of foreign governments for distribution among their shipmasters trading upon the high seas, who will lend their co-operation also, and who will first provide themselves with the requisite instruments for making the observations required, and for keeping the abstract log in the manner required.

It is desirable that the American shipmasters who wish to continue their co-operation, and to continue their claims to be entitled to new editions of Sailing Directions and Charts, should provide themselves with at least three thermometers, which have been carefully compared with a standard for every five degrees at least from 30° up to 100°.

The errors of the thermometer will generally be different for different parts of the scale. Hence the recommendation for comparisons at every five degrees. Nor should the shipmaster purchase a thermometer, even after it has been so compared, if its error in any part of the scale exceed 1°.

It is not required of American shipmasters, as a *condition* to entitle them to the Charts, that they should have thermometers of two scales, viz: Fahrenheit and the centigrade. Their attention is simply called to what the Brussels Conference says upon the subject, with the request that those who shall choose to follow those recommendations upon this point, will state in the abstract log that their thermometers are provided with both the Fahrenheit and centigrade scale. It is always the reading, they will please take notice, by the Fahrenheit scale that is to be entered in this abstract.

Every navigator, who, after receiving a copy of the Charts, fails to comply with these conditions, viz: to keep abstracts of his voyages as per form, and, on his return to the United States, to transmit them to me at the National Observatory, or, if a foreign vessel, to the person appointed in his own country to receive them, forfeits his claim to all future publications.

The Charts are to be had on application either at the National Observatory, Washington, or of George Manning, New York; provided the applicant will comply with the conditions above set forth. The following is the form of the receipt, which he is required to sign for such Charts as he may receive:—

FORM OF RECEIPT.

Received this *day of* 185

MAURY'S WIND AND CURRENT CHARTS; *for, and in consideration of which, I promise to keep, in the manner and form prescribed, a journal of my Voyages, and on my return to transmit the same to the National Observatory, Washington.*

_____

Commanding _____

of _____

Bound _____

I take this opportunity to repeat that the *point* of the compass from which the wind blows is what is wanted, also the variation *observed*, and not the variation that is taken from charts or books.

☞ The Abstracts are to be bound. Navigators, in keeping them, and in cutting the leaves out to be returned to this office, will please bear this fact in mind—and leave blank margins for binding;—and enter their winds, remarks, and the like, so that all for the same day may be read at one opening, as on the pages VIII., IX.

And whalemen will please recollect that their abstracts must embrace, for *every day they are not at anchor*, a regular record of their latitude and longitude, force and direction of the wind three times a day, temperature of the air and water, and mention of whales whenever seen.

When any of the routes herein recommended are tried, state whether you have had a longer or shorter passage than vessels sailing about the same time *without* the Wind and Current Charts on board, or without having tried these routes.

It is very desirable to know the temperature of the water, even for a few feet below the surface. Therefore, those vessels that are provided with the means of letting water into the hold, would render a valuable service by drawing a bucket of water through the cock daily, and recording its temperature. Let the water so drawn run a little while first, so that it may be of the natural temperature. State the depth of the cock below the water in the column for Remarks.
